

# Genetic load per deleterious SNP site by genomic feature and sorghum race

load per site = load\_raw ÷ n\_deleterious\_SNP\_sites\_in\_feature | Top 5% ZSS (< -5.15) | SAP panel (n = 400) | Shared y-axis — values comparable across features

Denominator is fixed per feature: exon = 8,157 sites, intron = 4,795, upstream = 8,782, downstream = 5,174, intergenic = 300,507.  
Higher value = individual carries more ZSS-weighted load per available deleterious site in that feature.
