

Raw genetic load distribution across genomic features by sorghum race

load_raw = $\sum(\text{dosage} \times |\text{ZSS}|)$ | No normalization | Top 5% ZSS (< -5.15) | SAP panel (n = 400) | Shared y-axis

Features ordered high → low within each race panel. Diamond = mean. Intergenic expected to dominate due to large number of SNP sites (300,507 vs 8,157 in exon).
